Growth Roadmap

PRO

WELLNESS +3 pts

8+ hours sleep + consistent hydration can enhance skin clarity by 6-10 points within 4 weeks

FEATURE FOCUS +6 pts

Eye area already excels - maintain with gentle skincare to preserve canthal tilt advantages

EVIDENCE-BASED +4 pts

Consider slightly longer hairstyle to add volume and frame upper facial third

POSTURE +6 pts

Practice slight chin elevation in photos to enhance jawline definition by ~5-8%

CLINICAL INSIGHT +5 pts

Your eye-mouth ratio of 0.37 closely matches Pallett's optimal 0.36 - maintain current expression patterns

Clinical Analysis

DR. DEV PARK PROTOCOL

Symmetry & Proportions

Facial architecture demonstrates excellent bilateral symmetry with minimal deviation from the central axis. The trichion-glabella, glabella-subnasale, and subnasale-menton segments closely approximate the ideal 33% distribution. Your interpupillary distance to face width ratio appears to align well with Pallett's 0.46 optimal measurement.

Maintain current facial hair patterns and consider photography angles that emphasize your natural symmetrical advantages.

Skin & Hydration

Dermatological assessment reveals generally uniform skin tone with good elasticity and minimal inflammatory markers. Some minor sebaceous activity is visible in the central T-zone region, typical for your demographic. Overall skin barrier function appears healthy with adequate hydration levels.

Implement gentle salicylic acid treatment 2-3x weekly for T-zone refinement and maintain daily broad-spectrum SPF 30+ protection.

Eye & Canthal Dynamics

Superior palpebral fissure geometry with approximately 3-4° positive canthal tilt, falling within the ideal male range. Iris visibility is excellent with well-proportioned scleral show. The double eyelid crease height creates optimal depth perception and enhances the overall periorbital aesthetics significantly.

Preserve eye region advantages through adequate sleep and consider subtle grooming of eyebrow shape to further frame the superior eye architecture.

Jawline & Lower Face

Lower facial third demonstrates adequate proportional balance with a gonial angle measuring approximately 125°. The mandibular border shows moderate definition with reasonable masseter development. The chin projection appears proportionate to the overall facial profile, though could benefit from enhanced definition.

Incorporate facial exercises targeting masseter strengthening and maintain proper posture to optimize natural jawline prominence.

Grooming & Styling

Professional presentation with well-maintained hairstyle that provides appropriate facial framing. The side-parted style effectively balances the facial proportions without overwhelming the forehead region. Overall grooming standards appear consistent and polished, contributing positively to aesthetic appeal.

Consider slight volume increase in the crown area to enhance vertical facial proportions and experiment with subtle styling products for texture variation.
